IBM Looks to capitalize on untapped cloud opportunity

ASSIGNMENT CODE 112
DEPARTMENT OF COMPUTER SCIENCE AND BUSINESS SYSTEM
NAME: HARSITA S
ROLL NO:7376232CB122

Introduction:

IBM (International Business Machines) is known for its hardware and software products, including computers, servers, storage systems and networking equipment. IBM corporation is a global IT and outsourcing company.

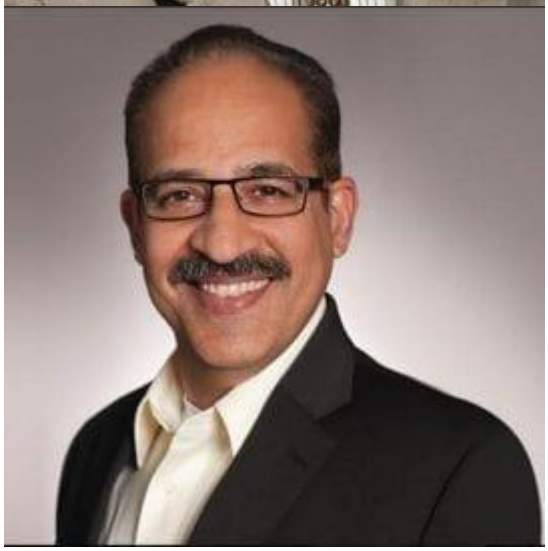
In the digital era, it is common for organizations to have multiple clouds for different and varying workloads. Big Blue, which has over several decades watched and led the transformation of the IT industry, is now looking to tap into the huge unexplored hybrid cloud market which it believes is the next big opportunity. IBM calls this as the chapter 2 of the cloud. While chapter 1 of the cloud was largely about moving a lot of new and customers facing application to the cloud, chapter 2 of the c;oud is the US $1.2 trillion hybrid cloud market.

IBM INDIA:

IBM INDIA, “cloud 1.0 in India was all about agility, scalability, time and cost savings. As businesses started down the path towards digitalization, it assisted them in being more nimble and automating procedures. Cloud 2.0 focuses more on leveraging the cloud's potential and the latest developments in digital transformation to support businesses in scaling and experiencing exponential growth. Cloud 2.0 focuses on modernization, administration, infrastructure, security, governance, and seamless integration, building on the agility and cost reductions provided by Cloud 1.0. India is leading the way in cloud adoption, with enterprises understanding its potential to help optimize current business systems, re-architect them, modernize them, and provide new business services at previously unthinkable speeds and levels of innovation.

Bajwa claims that IBM has positioned itself advantageously in the increasingly profitable hybrid cloud industry thanks to his company's approach of customising goods and services to customers' requests rather than what suppliers are attempting to offer. According to him, "We are always improving our cloud platform to make it easier for businesses to connect to the cloud by meeting their needs at every stage of the process, from speeding up the migration of current workloads to the cloud to modernising and expanding current apps to providing the necessary tools to create cloud-native apps from the ground up." Thanks to this tactic, IBM Cloud is now the entry point for blockchain, IoT, AI, and even cutting-edge technologies like quantum computing.

The market for hybrid clouds is enormous because it allows IBM to have a presence in several domains. states "The cloud market is redefining beyond the public Infrastructure-as-a-Service market," says Vikas Arora, vice president, IBM Cloud and Cognitive Software, IBM India/South Asia.



FIRST FIVE IBM CLOUD PARKS:

The first five IBM cloud parks focus on data, applications, Intergration, automation and multicloud management. This assumes significance when you look at the fact that organisation today are looking at creating a single source of data . Natrajan explains the benefits of a single integrated architecture using the banking industry as an example. "There has been a lot of inorganic growth within banks as a result of the rapid growth of banks. This has led to the creation of data islands, which have a domino effect on decision-making quality, customer-centricity, and other avenues for producing income. The IBM Cloud Pak for Integration can assist businesses in managing their integration architecture more easily and more affordably, as well as in putting up the proper organisational models and governance procedures to facilitate agile integration.

AQUISITION OF RED HAT – A GAME CHANGER:

Red Hat's open source innovation is now available to a wider spectrum of clients thanks to the purchase, which has changed the game. Businesses can get the hybrid cloud solutions they need from IBM and Red Hat, which are built on open source technologies like Linux and Kubernetes and give real choice and agility. Bajwa explains, "Hybrid multicloud environments will be based on a foundation of 'open' as clients will look at securely deploying, running, and managing their mission-critical workloads across on-premises, private, and public cloud environment." With the top-ranked Linux operating system and the industry-leading hybrid cloud platform, OpenShift, Red Hat is at the core of this. We are in a good position to combine these with IBM's enterprise incumbency, scale, and expertise.

Forrester Consulting was recently hired by IBM as part of developing "Total Economic Impact" research, which aims to investigate how customers use products from both businesses simultaneously and the resulting impact. These firms implemented a broad range of Red Hat (Red Hat Enterprise Linux, OpenShift, JBoss, and professional services) and IBM (IBM Power, IBM Z, IBM Cloud Paks, middleware, and professional services) solutions. According to the report, businesses boosted release frequency by up to 10 times, sped up development cycles by up to 66%, and cut infrastructure hardware and licencing expenses by as much as 50%.

With the acquisition of Red Hat, IBM gains a significant edge as open technologies like containers and Kubernetes become the common fabric for both creating cloud-native applications and modernising legacy programmers. To run on Red Hat OpenShift, for instance, IBM has optimised over 100 items from its vast software portfolio. Now that Red Hat OpenShift has been optimised for IBM software and new Cloud Paks, organizations may develop mission-critical apps only once and deploy them across all private and public clouds.

AI POWER:

IBM aspires to be the nation's face of artificial intelligence. According to Viswanath Ramaswamy (Vishy), Director of Systems at IBM South Asia and India, "We are doing to AI what Red Hat did to Linux." With Power AI, you may select any AI framework you want. Everybody's AI path is different at this point.

In support of his argument, Ramaswamy cites the example of IFFCO Tokio General Insurance, which analyses the extent of the damage to personal cars using IBM Power9 and the optimized DL frameworks that come with Power AI software for image processing. This allows them to create a list of the parts that were damaged in the accident and are both repairable and replaceable. In a short while, the evaluation and the price are provided to the client, which they have the option to accept or reject. Payment is made immediately to the customer's bank account within 15 minutes if the assessment is approved.

TATA COMMUNICATIONS AND NVIDIA FORGE PARTNERSHIP TO BOOST AI INFRASTRUCTURE IN INDIA

Assignment code cs 5

DEPARTMENT OF COMPUTER SCIENCE AND BUSINESS SYSTEM

NAME: HARSITA S

ROLL NO: 7376232CB122

INTRODUCTION:

Through a content delivery network, Tata Communications provides private line and Ethernet services in addition to various support services including transcoding, security, satellite teleports, and fiber-based video networks.

About TATA

The TATA group of companies headquartered in Mumbai, India. Establish in 1868, it is Indias's largest conglomerate, with products and services-based works. It includes aviation, steel, power, chemicals, and information technology which is IT. TATA is also a "trustworthiness that the brand has earned is the result of the toil of so many years of keeping all our stakeholders at the center of the business, and serving them very well"

In 2022-23, the revenue of TATA companies, taken togrther, was over $150 billion.

About NVIDIA

NVIDIA (NASDAQ: NVDA) has led the way in accelerated computing since its establishment in 1993. The company's 1999 creation of the GPU launched the current era of artificial intelligence, revolutionized computer graphics, propelled the PC gaming industry, and is driving industrial digitalization in a variety of industries. With its data center-scale offerings, NVIDIA is now a full-stack computing firm that is revolutionizing the industry.

This press release contains certain statements about, among other things: NVIDIA's partnership with Tata Group and its advantages and consequences; the advantages and consequences of NVIDIA's products, services, and technologies, such as the GH200 Grace Hopper Superchip; the global generative AI race being fully underway; data centres moving to GPU computing to build energy-efficient infrastructure to support the exponential demand for generative AI; NVIDIA's partnership with Tata as they expand their cloud infrastructure service with NVIDIA AI supercomputing to support the exponential demand of generative AI startups and processing of large language models; the impact of AI and machine learning; and Tata Group's presence across

sectors combined with NVIDIA's capabilities are vulnerable to risks and uncertainties that could lead to outcomes that differ significantly from initial projections. Significant variables that could drastically alter the actual results

TATA COMMUNICATION:

A digital ecosystem enables that power today’s fast growing digital economy.

The company unlocks opportunities for businesses by enabling borderless growth, boosting product innovation and customer experience, improving productivity and efficiency, building agility, and managing risk. It powers the digital transformation of enterprises worldwide, including 300 of the Fortune 500.

Tata Communications propels the next level of intelligence powered by cloud, mobile, Internet of Things (IoT), collaboration, security, and network services. It does this by utilising its solutions-oriented approach, tested managed service capabilities, and state-of-the-art infrastructure. Approximately 30% of global internet routes, 80% of the world's cloud giants, and 4 out of 5 mobile customers are connected to businesses through Tata Communications. The company's global network, which includes the biggest wholly owned subsea fibre backbone in the world and a Tier-1 IP network with connection to more than 190 nations and territories

worldwide, is the foundation of its capabilities. Both the National Stock Exchange and the Bombay Stock Exchange list Tata Communications Limited.

Tata Communications has contributed to India's rich history of internet usage. Enterprise-enabled services have been crucial to the nation's adoption of digital services during the last 25 years. Connectivity is a vital component of the economy, from transformation to utility. With its distinct promise of providing safe, connected digital experiences, Tata Communications is dedicated to empowering industry leaders in this New World of Communications.

The Collaboration:

With the partnership between Tata Communications and NVIDIA to deliver cutting-edge computing infrastructure and platforms for AI development and deployment, India's AI goals are given a significant boost. Tata Communications, a top worldwide provider of digital infrastructure, and NVIDIA, a market leader in computer graphics processing units (GPUs), have announced a strategic relationship that might have a big impact on India's artificial intelligence (AI) scene. According to AS Lakshminarayanan, Managing Director and Chief Executive, the Tatas would support the government's AI mission by offering researchers and startups AI services.

This collaboration aims to accelerate the development and deployed of AI solution across India by providing robust computing infrastructure and platforms. The competition to become the global leader in AI is intensifying, and India is aggressively vying for prominence. Businesses and academic institutions all throughout the nation are becoming more aware of how AI has the ability to completely transform a number of industries, including manufacturing, agriculture, healthcare, and finance. But the creation and application of AI solutions necessitate a significant amount of processing power, frequently more than conventional central processing units (CPUs) can provide. This is where the parallel processing architecture of GPUs comes into play, giving them a major advantage.

GPUs from NVIDIA are well known for their capacity to effectively manage challenging AI workloads. Large, complex AI models may be trained and executed with exceptional performance thanks to the company's latest generation GPUs, such as the NVIDIA® GH200 Grace Hopper Superchip.

On the other hand, Tata Communications contributes its experience in creating and overseeing reliable international network infrastructure. Their large data centre footprint and fast connectivity options will serve as the cornerstone for a dependable and expandable AI cloud platform. With the help of this platform, companies and researchers will have access to the processing power needed to create and implement cutting-edge artificial intelligence solutions.

THE PARTNERSHIP:

Constructing a World-Class AI Supercomputer: The two businesses intend to work together to create an AI supercomputer that runs on the next NVIDIA GPUs. This supercomputer will serve as a national asset, providing businesses and researchers with unmatched processing capacity to address challenging AI problems. Building a Robust AI Cloud Platform: Users will be able to remotely access the computing resources required for AI development and deployment through the establishment of a sturdy AI cloud platform. By doing away with the requirement for pricey on-site infrastructure, this cloud-based method opens AI to a larger spectrum of businesses.

This will provide a talent pool that is ready to use AI's capability for a range of purposes.

The potential for this partnership to advance India's AI efforts is enormous. Here are a few of the anticipated advantages:
